temic decision theory is that its decision rule is formulated for any arbitrary partition of states  $B$ . The additional difficulties introduced by the problematic notions causal decision theorists appeal to are nicely illustrated by the problem of finding an adequate partition of states  $K$ , for Skyrms' formulation.

Indeed, a relatively influential new approach to theorizing about rational choice has come to be called "causal decision theory". 1 Decision problems such as Newcombe's Problem and some versions of the Prisoner's Dilemma where an act counts as evidence for a desired state even though the agent knows his choice of that act cannot causally influence whether or not the state obtains have motivated causal decision theorists.

Two-boxers give priority to causal beliefs, and one-boxers to evidential beliefs. A similar issue can arise when the modality in question is chance, rather than causation. In this case, the conflict is between decision rules based on credences guided solely by chances, and rules based on credences guided by other sorts of probabilistic evidence.
