emissions low but at the same time increases instability (combustion dynamics) in the gas turbine engine. This instability can damage components in the combustion chamber such as nozzles, baskets and transition pieces, as well as downstream components such as blades, resulting in downtime and loss of revenue.

Monitoring and mitigating combustion dynamics By Phil Karwowski, Siemens Power Generation Inc Dry low-NOx (DLN) combustors have dramatically lowered pollutant emissions and reduced the consumption of high-purity water at gasturbine-based powerplants. But they are prone to flame instability under certain operating conditions.
